Team and R. Bilotti February 26, 2002

Charter Communications: 4Q01 Results and 2002 Guidance

Team and R. Bilotti February 21, 2002

Comcast Corporation: 4Q01 Results and 2002 Guidance

Team and R. Bilotti February 20, 2002

- **Our cable television industry view: Attractive**

We estimate the aggregate equity value of the industry should appreciate 20-25% in each of 2002 and 2003 (or 45-50% on a cumulative basis).

- **ROIC and system values should rise as capex declines over next three years**

After 15 years of rising expenditures, new technologies are beginning to have a profound effect on the profitability and operating risks inherent in broadband networks.

- **Benefits of new technologies are accruing to the MSOs and their customers**

Digital video, high-speed data, and local telephony are each duopoly markets with price stability.

- **EBITDA growth of 13-14% & declining capex are fulcrums for improving ROICs**

Rising ROIC should justify 13-15 times EV/EBITDA ratios for most of the MSOs.

- **Pretax unleveraged free cash flow should reach \$260-310 per sub by 2005-06**

This compares to marginally breakeven in 2001.

Rise & Fall of Programming/Capital Expenditures

Morgan Stanley & Co. Incorporated ("Morgan Stanley") is currently acting as financial advisor to Comcast Corp. ("Comcast") in its announced proposed merger with AT&T Broadband.

The proposed transaction is subject to, among other things, the approval of shareholders of Comcast and AT&T Corp. This report and the information provided herein is not intended to (i) provide voting advice, (ii) serve as an endorsement of the proposed transaction, or (iii) result in the procurement, withholding or revocation of a proxy or any other action by a security holder.

Comcast has agreed to pay fees to Morgan Stanley for its financial services, including transaction fees that are contingent upon the consummation of the proposed transaction.

Please refer to the notes at the end of the report.

Summary and Investment Conclusion

Our cable television industry view is **Attractive**, and we estimate that the aggregate equity value of the industry should appreciate 20-25% in each of 2002 and 2003 (or 45-50% on a cumulative basis). The cornerstone of our Attractive view is the hypothesis that rising returns on invested capital (ROIC) will justify 13-15x enterprise value-to-EBITDA (EV/EBITDA) ratios for most of the major multiple system operators (MSOs). Consistent 13-14% EBITDA growth and declining capital expenditures are the fulcrums for improving ROICs.

The benefits from new technologies are accruing to the MSOs and their customers. In many telecommunications sectors, the presence of multiple carriers has led to price competition that overwhelmed product innovation and cost efficiencies. As a result, profitability has declined. Digital video, high-speed data, and local telephony are each duopoly markets with price stability. In previous reports we have focused on the impact that robust demand for new services (digital video, cable modems, and cable telephony) will have on revenue growth and ROIC.

We believe that ROIC and system values also will rise as capital expenditures decline over the next three years. After 15 years of rising expenditures, new technologies are beginning to have a profound effect on the profitability and operating risks inherent in broadband networks.

- Historically, the types of hardware employed defined the capabilities of systems. Looking ahead, the capabilities of systems will be defined by the types of software employed, in our view. This shift signals a reduction in required or recurring capital expenditures.
- Software-defined networks are more complex than unidirectional networks. Operating expenses, mainly the people needed to run the networks, should rise significantly. EBITDA margins of the MSOs should become far less homogenous. New service penetration (i.e., utilization), clustering, and network provisioning should become the drivers of EBITDA margins.

We have employed discounted cash flow models as the principal valuation methodology for arriving at the 13-15x EV/EBITDA range noted above. The last section of this summary uses a generic industry model to demonstrate the value of a typical cable television system or subscriber.

Average Capital Expenditures Should Decline from \$250 to \$120-150 per Subscriber

Over the past five years the cable television industry has incurred massive expenditures to rebuild its networks. Traditional "tree and branch" one-way networks were replaced with two-way hybrid fiber-coaxial networks. Most of the rebuild programs will be completed in 2002 (Cox, Comcast, AOL Time Warner, and Insight) or 2003 (Cablevision, Charter, Adelphia, and AT&T Broadband). During the period from 1998 through 2002, annual capital expenditures averaged \$230 per subscriber.

Just under one-half of the 1998-2002 capital expenditures, or \$90-110 per subscriber, were related to the rebuild programs. We estimate that the typical cost to rebuild a cable system was \$500 per subscriber (Exhibit 4). A typical system project takes 18-24 months to complete, but an entire company takes about four years as there is a practical limit to the number of projects that can be managed simultaneously. Success-based expenditures, which directly correlate with new service deployments, were another \$50-80 per basic subscriber. The remaining \$60-70 per subscriber is normal recurring network requirements.

We expect that capital expenditures per subscriber will drop to \$170 in 2003 and average \$150-160 in 2004-2007. The decline will mirror the completion of the rebuilds. The av-

erage capital expenditures in later years will be the sum of normal recurring maintenance and incremental customer premises equipment to provide new services. It should be noted that the 2004-2007 capital expenditure forecast includes about \$20 per basic subscriber per year for telephony deployments.

Maintenance Budgets and Incremental Capacity Should Be \$60-70 per Subscriber

We estimate that replacement capital expenditures will gradually rise from \$50 per subscriber to \$60. Additional bandwidth and system extensions should add another \$10-15 and \$15-20 per subscriber, respectively. The financial risk of maintenance budget overruns is minimal. Almost every cable system expends the cost of replacing components that fail before the end of their useful life.

Exhibit 7 illustrates the maintenance expenditures for a rebuilt hybrid fiber-coaxial system. The useful life of the network components is the most significant assumption. From the 1950s through the late 1990s, the useful life of a network was not defined by the physical life of the assets. Instead, every 7-8 years the industry would retrofit its systems to expand the bandwidth in order to offer new services. We estimate that the actual useful life for most components is 10-12 years.

Over the next decade electronics and software will cut the cost of additional bandwidth to one-quarter of the historical cost. We estimate that the cost to quadruple the effective bandwidth of a system, by reducing the average node from 1,000 to 250 homes, is about \$125 per subscriber (Exhibit 6). Construction labor costs are \$60 per subscriber, or about 25% of the level incurred in the original rebuild. We assume that the bandwidth augmentation occurs in 2005 through 2010.

Reducing the average node size from 1,000 homes to 250 homes would essentially allow all of the MSO's subscribers to simultaneously use VOD (video on demand) and receive 1.5 megabits per second of data service. The augmented system would also have telecommunications grade reliability. Please note that our current demand forecasts do not require this level of capacity, and we expect a large portion of the capacity will be held in reserve.

New Service Expenditures Should Be \$50-80 per Subscriber

Additional penetration of new services will probably require \$50-80 of annual capital expenditures per basic subscriber.

The cost of a digital set-top is currently \$280 (including installation costs), or less than two-thirds of its price in 2000. Similarly, the cost of a DOCSIS 1.0 cable modem has dropped 75% in the last 24-36 months to \$85 per unit.

Servers and routers, the central core of interactive services, are marginal costs at best. At current prices the servers required to facilitate the VOD capability would be about \$60 per digital customer or \$30 per basic customer assuming 50% digital penetration. The routers for the data service would be \$150 per high-speed data customer if 1.5 megabits per second was the standard service (300-500 kilobits per second is the current standard). The routers could be installed over a 5-7 year period as the standard is gradually raised.

The Risks Are in the Human Element

Complex technology requires sophisticated employees. Over its history the cable industry has followed the financial paradigm that the lowest costs produce the highest returns. We suspect that future will not be as simple.

A typical cable system of 300,000-400,000 homes will need at least 100 specialized technicians to support its interactive and high-speed data services. Flow-through provisioning is the current industry mantra. For laymen, it essentially means that all of the network elements and customer premises equipment can be controlled through software. The various software elements must be integrated and minimize multiple human touches.

Software and technicians are fixed costs. Operating leverage is a two-dimensional concept. Clustering creates the largest potential footprint and penetration is akin to network utilization. Two examples highlight the potential impact of operating leverage

Cox has launched digital, data, and telephone services over the last five years with minimal start-up losses. It has a high degree of clustering and this allowed the penetration of its services to match the increase in its fixed-cost base.

AT&T incurred large start-up losses on data and telephony services in 1999-2001. Its initial level of clustering was far behind Cox, and its provisioning systems, especially for telephony, were rudimentary. Headend consolidation and back-office integration should allow AT&T gradually to return to normal 38-40% EBITDA margins by late 2003 or early 2004.

Price stability is the other key ingredient for healthy EBITDA margins. We estimate that the technical systems, backbone, and customer service expenses for a high-speed data subscriber average \$20 per month. These costs are a direct function of the technology employed and do not vary with revenue. At a \$45 per month service rate, the margin on an incremental subscriber is 55%. A \$10 drop to \$35 per month cuts the margin to 43%. Telephony and interactive video display the same characteristics.

How to Value a Broadband System

Valuing a cable television system is a study in operating leverage. Broadband services have historically shown very modest economic sensitivity. In contrast, broadband operating and capital costs are inexorably tied to technology cycles.

- Once network rebuilds are completed, capital expenditures should finally decline for the first time in 15 years. No other indication may be as critical in proving the hypothesis of rising ROICs.
- Pretax unleveraged free cash flow (EBITDA less capital expenditures) was marginally above breakeven in 2001 and should reach \$260-310 per subscriber by 2005-2006. The principal risk is probably in the operating margins rather than in the forecast revenue growth and capital expenditures.
- Clustering and new service penetration are the keys to leveraging the fixed operating costs that result from complex technologies, in our opinion. The best operators can probably sustain 40-45% operating margins while the laggards may decline toward 35%.
- Price stability can also drive margins. However, price leadership is a direct function of driving penetration and establishing dominant market share. Price increases for data services have become practical as the RBOCs have consistently failed to demonstrate an interest in a competing service. Interactive video is a wild card. Broadband technology is superior to satellite/PVR (personal video recorder) systems, but the spoils will likely go to the first mover rather than the best system.

We use a discounted cash flow model as our primary valuation methodology. Exhibits 1-3 illustrate the results for the entire industry, which can be viewed as a proxy for a generic system. Including telephony we estimate that the

average cable television system is worth 14-15 times current EBITDA. The multiple falls to 13-14 if telephony is excluded.

There is no question that the single most important input is the operating forecast. The early years, 2002-2003, are especially important as they serve as the base for establishing trends. It should be noted that the industry displays a sharp acceleration of EBITDA growth to 15-17% in 2002-2004. About 200-300 basis points of the annual growth is due to the rapid improvement in EBITDA margins at AT&T Broadband. Most of the margin improvement at AT&T Broadband is due to the critical mass reached in its telephony services, and a resulting shift from start-up losses to incremental EBITDA. Without AT&T, the EBITDA growth for the rest of the industry is 13-14%.

The discount rate is another crucial variable. We assume an 11.75% weighted average cost of capital. Equity is assumed to have a 15-17% required rate of return, leverage is expected to average 40-50% of the total market capitalization, and taxes are set at 40%.

The terminal value is the component that is most often overlooked. We estimate that the average terminal value is 9.5-11.5 times forward EBITDA. The ratio is based on the theory that revenue growth will drop to 6-8% after all of the new services reach relatively mature penetration levels. The EBITDA multiple is also equivalent to about 20 times NOPAT (i.e., unlevered after-tax earning power).

Technology should lower capital expenditures, which, in turn, should increase free cash flow and, finally, culminate in robust terminal values. If this thesis is wrong, each 10% increase in long-term capital expenditures will lead to a 4-5% reduction in system values.

From another perspective, if capital expenditures are higher than expected, then future depreciation charges will also rise. Higher depreciation leads to lower NOPAT and lower ROIC. Terminal EBITDA and NOPAT multiples would both be compressed by lower ROIC.

Conversely, in 1996, interactive video was still a dream and high-speed Internet service was as yet undiscovered. If improvements in technology lead to more services, revenue growth could be understated. The revenue, margin, and capital expenditure assumptions in our current model are intended to represent a base case.

Digital Video and Video-on-Demand Update

Summary and Investment Conclusion

We expect the US cable industry to add 5.5 million digital cable subscribers in 2002, down about 6-7% from 2001 net additions of 5.8 million. This would represent an increase in penetration of basic subscribers from 21% at the end of 2001 to 28% at the end of 2002 for the cable industry. Our expectation is that 45-50% of the 70-72 million basic cable subscribers in 2005 will take digital video service. The industry reaches this digital penetration rate, we believe, with declining additions of approximately 10-15% per year until 2005.

(1) Both ADLAC and CMCSK report digital boxes. We have converted these to digital subscribers assuming 1.25 boxes per subscriber.

Source: Morgan Stanley Research Estimates

To evaluate the 50% penetration expected by 2005, we believe premium services are a strong proxy for demand. Premium unit penetration of basic has peaked at about 70-80% for most cable operators. However, because cable subscribers who receive premium services receive more than one service, only about 35-40% of basic subscribers take a premium service. In effect, our 50% forecast implies that some subscribers who have not historically opted for premium channels will upgrade to digital.

Not all operators are demonstrating the same new RGU (revenue generating unit) growth profile. We believe that Cox's guidance for slightly improving RGU additions in 2002 implies that digital additions would be flat, at worst, with 2001 levels and possibly higher. We forecast just fewer than 16 million digital video subscribers by the end of 1Q02, representing additions of 1.34 million during the quarter, which compares to 1.62 million in 1Q01, or a 17% decline. By the end of 2002, we expect that more than 90% of total cable homes passed will be upgraded for digital services.

Exhibit 21

Looking at Digital Cable and DBS Additions...

Source: Morgan Stanley Research Estimates

Danger of Sequential Growth Metrics

Digital cable is now the de facto video product for most cable operators in markets where digital is available. As a result, digital growth is demonstrating the same seasonal factors as basic growth has shown over the years. For this reason, sequential growth in absolute subscribers is very misleading. Most operators have seen that the basic growth has historically shown a 40%-10%-10%-40% quarterly pattern with respect to percentage of total annual additions.

Exhibit 22 shows 2001's quarterly additions for digital cable and DBS, as well as our forecast for 2002 by quarter. We are using Morgan Stanley satellite analyst Vijay Jayant's estimates for DBS.

Exhibit 22

Beware of Sequential Growth Metrics...

Source: Morgan Stanley Research Estimates

As the exhibit indicates, there is no linear trend throughout the year with regard to digital additions. Each MSO shows slightly different trends depending on the location and demographic of its systems. Finally, various marketing and promotional campaigns should continue to affect seasonal trends for the next several years. However, the critical lesson, in our view, is that sequential growth is *not* a good proxy for product demand. Ideally, one would want to analyze year-over-year growth in stable markets where a new digital footprint is not being added.

What to Watch for in 2002...

For all cable operators, 2002, we believe, will be a critical year in the VOD (video-on-demand) and S-VOD (subscription video-on-demand) rollout. The cable operators have all announced trials, and many have deployed VOD or S-VOD to entire markets. While final pricing has not yet been determined, VOD and S-VOD will allow the MSOs to differentiate themselves from the DBS operators. MSOs have conducted trials of multiple price points with movies, comparable to video rental prices, and with S-VOD prices ranging from \$0 (i.e., included with digital service) to \$10 per month, depending on the content. The MSOs also hope to use the products to lower churn on the digital product and to get basic-only subscribers to upgrade to digital. Charter, for example, has indicated that in its Los Angeles system, where VOD has been offered for over 18 months, churn has decreased from an average of 6-8% to less than 4%.

While poor windows on new movie releases remains an issue, MSOs have realized that full-length movies are not necessarily the only compelling source of on-demand content. The companies are considering packaging non-movie

content such as children's shows. In several of its VOD-enabled markets, Charter already offers a subscription-based package of children's programming for about \$9.95 per month.

Exhibit 23

S-VOD Launches

MSO, City	Launch Date	Networks Launched	Price
Adelphia - Cleveland	Sept 2001	HBO, Starz, Showtime	Free w/ digital purchase
Cablevision - Long Island	Sept 2001	HBO, Starz, Showtime	Free w/ digital purchase
Time Warner - Columbia S.C.	July 2001	HBO	\$3.95/month
- Austin, TX	Nov 2001	HBO	\$6.95/month
- Cincinnati	Jan 2002	HBO	\$9.95/month

Source: Multichannel News

Many basic networks are expected to test VOD and/or S-VOD during the year. Networks such as A&E, MTV Networks, ESPN, Discovery Networks, and BBC America have signed deals with certain MSOs to launch the service at some point this year. It is still unclear how the VOD business model for basic networks will work. There have been concerns that the service will cannibalize ratings and advertising revenue from the existing basic networks. Other outstanding issues include pricing, packaging, and the decision of whether to include advertisements.

For Cablevision, 2002 will be a critical year for the digital rollout, in our opinion. The company launched its digital service on September 28, 2001, and ended the year with just over 17,000 customers. The company gave guidance of 125,000-150,000 customers by the end of 2002. It will be important for the company to launch other markets during the year (Nassau County and part of Westchester County already have the service). We believe the lack of a digital product over the past couple of years has adversely affected the company's basic customer growth. Difficulties in rolling out digital service at Cablevision could be partially related to its technology platform, which is based on Harmonic (HLIT, NR) digital head-ends and transmission equipment and Sony digital set-top boxes. Other MSOs use some combination of Scientific Atlanta and Motorola equipment. We believe that Cablevision has largely resolved these technical issues and should be able to accelerate digital growth in 2002.

Broadband Cable Television – April 5, 2002

Updates During the Quarter

- **Adelphia:** Has launched S-VOD in its Cleveland systems and plans to launch the service in the entire PONY (Pennsylvania, Ohio, New York) ring. The company estimates that about 400,000 customers are currently VOD-enabled, about 51,000 of who are digital subscribers.
- **AOL Time Warner:** Time Warner has awarded contracts for VOD rollouts for 38 systems. Concurrent recently announced that it has agreements to deploy VOD in another five Time Warner markets, which cover 1.5 million basic subscribers and about 500,000 digital subscribers. This brings Concurrent's total to 15 Time Warner markets. Time Warner also announced that it will use nCUBE in its Los Angeles and New York markets to deploy VOD (as well as six other unannounced markets). SeaChange recently announced that it has won VOD deployment contracts in a total of 16 Time Warner markets. The VOD launch in Cincinnati includes HBO S-VOD at \$9.95 per month and content from the Food Network and Home & Garden Television on an a la carte basis.
- **AT&T Broadband:** Has launched VOD in Atlanta and Los Angeles. We believe the pending merger with Comcast has slowed its rollout of VOD and we don't expect this to change near-term.

- **Cablevision:** Launched its VOD service with its digital roll out at the end of last September. Initial data show high take rates on the product. Cablevision also offers S-VOD for no additional charge for those digital customers who subscribe to HBO, Starz, or Showtime.
- **Charter:** Has several trials of VOD. Has not yet launched a premium S-VOD service, but, in some areas, offers an S-VOD package of children's programming for \$9.95 per month. Charter has used Diva as its sole VOD equipment provider thus far, and we would expect it to select a second vendor in the near term.
- **Comcast:** The company recently finalized an agreement with TVN Entertainment Corp. (TVN) to deliver content in 11 markets. Comcast ended 2001 with 3 million VOD-enabled homes and expects to end 2002 with 5-6 million.
- **Cox:** The company expects to launch VOD commercially in seven markets by the end of 3Q02, representing 43% of homes passed. Expects to launch S-VOD in selected markets in 2002.
- **Insight:** Plans to launch S-VOD by the end of 2Q02. While pricing for S-VOD has not yet been determined, Insight does plan to charge for the service. As for VOD, Insight estimates that about 15% of its 950,000 VOD-enabled customers are using the VOD service. The company has about 350 titles available, but it is in discussions with TVN Entertainment Corp. to provide additional content. Like Charter, Insight has used Diva as its sole VOD-equipment provider thus far, and we would expect it to select a second vendor in the near term.

Updates on the Content Side

- In January, In Demand L.L.C. signed a deal with Dreamworks SKG that would allow In Demand to distribute Dreamworks's content on a VOD basis. Details of the agreement were not disclosed. In Demand also has deals with Columbia Tri-Star, Universal Pictures, and Artisan Entertainment. In addition to these studios, In Demand has struck content agreements with Hallmark Entertainment, ESPN, Courtroom Television Network, Comedy Central, Turner Network Television, and Cartoon Network.

Broadband Cable Television - April 5, 2002

Please see the important disclosures at the end of this report.

- MagRack currently provides VOD content to Cablevision and has about 22 niche magazines that range from automobiles to cooking.

Note: The following piece was written by Michael Lynch and Scott Coleman of the wireline networking equipment group in Morgan Stanley's Research Department.

Why VOD Now? What Has Changed? Two questions we expect investors to ask are, "why VOD now" and "what has changed" fundamentally that improves the prospect for widespread VOD deployments? There have been many stops and starts with VOD deployment. We believe that over the past two years the main barriers to VOD deployment have been largely eliminated, including:

- *Cost per stream has declined to the point where VOD makes sense economically for the MSOs.* The price per stream to deliver on-demand content has declined significantly in the past two years. We believe that the average cost per stream declined from \$600 in 2000 to around \$400 in 2001. We expect this cost to decline approximately 22% on a compound annual basis through 2006.
- *Critical mass of digital subscribers and set tops.* We estimate that as of year-end 2001 there were approximately 14.7 million digital cable subscribers in the US. By 2006, we estimate there will be 35 million digital cable subscribers (a 2001-2006 CAGR of 18%). We assume that new subscribers in 2001 take, on average, 1.25 digital set-top boxes (STBs) per home, and that, by 2006, this could grow to 1.7 STBs per home (we believe that MSOs are planning for multiple streams per home, but at a much lower multiple than STBs per home). We believe there is now a critical mass of digital subscribers and set tops over which MSOs can offer VOD as a way to leverage their investment in two-way digital network upgrades.
- *Content availability no longer a concern.* One of the primary concerns surrounding VOD has been content availability, particularly since VOD content in the past has been viewed solely as movies. Although new content must continually be made available for VOD to succeed, we believe this concern is unfounded for two reasons. First, six of the seven major movie studios have agreements to provide content for VOD, which leads us to believe that there should be a suitable amount of movie content available. We highlight that the take rates of VOD movie trials (about 2-3 per month on average) exceed what we believe is the average active subscriber rental rate at Blockbuster of about 1.5 rentals per month. A higher take rate for VOD could lead the studios to re-think some of their release windows. Second, the success of subscription VOD (S-VOD) leads us to conclude that non-movie content (sports, educational programming, children's programming, etc.) will also be made available for VOD service. Given the positive activity on the content front, we think the real challenge for the MSOs will be to find the right mix of content to maximize revenue.
